

Here's something a bit different, a couple of high quality, not to be confused with your el cheapo, heat exchanger oil coolers you can see plenty of on the internet.

This has been used as a raw water oil cooler on a Twin Disc gearbox. This is a quality piece of kit with a cast bronze body. We have two of these available and they are only for sale due to complete repowering of the vessel. ID of the inlet and outlet fittings is 50mm.

If you are comparing anything to these, this unit weighs around 7kg with the end fittings.

What are they worth? Does \$500.00 each sound about right for these items? You tell me what they are worth.
